MFIA 5 MHz Impedance Analyzer and Precision LCR Meter

Product Description
Version: Feb 2023

Key Features
- 1 mHz to 5 MHz, 1 mΩ to 1 TΩ
- 0.05% basic accuracy
- LabOne® Sweeper for frequency, bias voltage and test signal amplitude response measurements
- Compensation Advisor and Confidence Indicator for accurate measurements
- 25 s start-up time and high repeatability
- APIs for C, MATLAB®, LabVIEW®, Python, .NET
- Full MFLI lock-in amplifier functionality

Summary
A fresh approach
The MFIA 5 MHz Impedance Analyzer and Precision LCR Meter provides fast and accurate measurements over a wide impedance range. Unlike other impedance analyzers the MFIA measures the voltage and the current signals directly without needing a balanced-bridge configuration. As a result the MFIA is capable of measuring at frequencies as low as 1 mHz and providing reliable impedance measurements up to 1 TΩ. Further, it allows for a fast LCR Mode providing impedance measurements significantly faster than bridge instruments.

Software that makes a difference
The LabOne user interface helps the user to maximize work efficiency. The complete toolset including a flexible parametric sweeper, data acquisition module, and plotter make light work of acquiring relevant impedance parameters. Instrument and user interface settings can be saved and reloaded to repeat measurements and provide traceability. All measurement functions are also available at the API level via the included APIs for C, MATLAB®, Python, LabVIEW® and .NET.

The LabOne Compensation Advisor helps the user with the elimination of any adverse effects caused by their test fixture or cabling in order to achieve reliable and accurate measurements. In addition, each data point is validated by the LabOne Confidence Indicators and suggestions are made in case data points were compromised.

Detailed description
LabOne toolset
The MFIA comes with the LabOne instrument control software and runs an embedded data and web server that provide the graphical user interface to any web browser. Simply add the MFIA by ethernet into your local network or connect directly by USB, type the instrument address or use the MF-Device finder tool to select your instrument and get up and running with LabOne. Data from each tool can be stored as vector graphics or a plain data file with a single mouse click. For further analysis in other software, ZView®, MATLAB® as well as customized CSV export file formats are supported. Cursor-based math and statistical functions are available for an initial data analysis in both time and frequency domain.

Looking at the most important LabOne tools in detail:

Sweeper
The Sweeper enables the user to automate measurements by scanning instrument parameters over a defined range with a freely adjustable number of scan steps, either linearly or logarithmically. Most importantly, the recording of frequency dependence as well as the variation of bias voltages or test signal amplitudes can be easily automated. A variety of application modes help the user to measure with the optimal settings and get the most accurate results in a minimum of measurement time without tedious manual tweaking. A typical sweeper application is illustrated on the next page.
**Numerical**
The Numerical tool displays all measurement values and model parameters in a user configurable format. You can decide which parameters matter most and display only what is relevant for your work. Each impedance unit allows simultaneous viewing of the impedance value as well as the underlying current and voltage measurements plus the model based derived parameters (L,C,R, etc.).

**Plotter and Data Acquisition**
The Plotter and Data Acquisition module are tools to analyze measurement data and model parameters in the time domain. The Plotter can display and acquire multiple data streams continuously on time scales ranging from 12 hours down to 10 μs. The Data Acquisition module captures and displays individual shots based on numerous different internal and external trigger conditions.

**Confidence indicator**
All measurement data pass a confidence estimation before being presented to the user in the different tools. Whenever the measurement is compromised by either suppression, underflow, compensation error, etc. a warning flag is raised and the user is informed that the data might be inaccurate. Depending on the type of warning, suggestions are made in order to improve the result.

**Compensation advisor**
In order to achieve high measurement accuracy, parasitic effects caused by the test fixture or cabling between the instrument and the device under test (DUT) need to be compensated. The LabOne Compensation Advisor provides users with step-by-step guidance and an efficient workflow to achieve maximum measurement performance. In addition to Short (S) and Short-Load (SL) compensation, a variety of other compensation schemes are offered. Each compensation step is validated and feedback provided to the user before the data is taken to correct for measurement errors.

**Test fixture and additional interfaces**
The best measurement results can be obtained by using the MFITF Test Fixture. Both the test fixture and the DUT carriers are designed to introduce minimal parasitics and damping. However, the instrument is made to be fully compatible with other commercially available test fixtures and impedance setups. Auxiliary Outputs and Inputs provide and receive additional control signals to the DUT or analog feedback to other instrumentation. DIO connectors and Trigger ports enable measurement methods that require precise synchronization with other parts of the setup.

---

**LabOne user interface**

Automate your measurements with the LabOne Sweeper and scan the frequency, bias voltage, and test signal amplitude. The example on the right shows a frequency sweep from 100 Hz to 5 MHz of a 1 GΩ resistor in a dual-plot representation. The top plot shows the absolute value of the impedance |Z| and the resistance Rp. The bottom plot shows the measurement of the stray capacitance Cp staying constant at about 30 fF over the entire scan range. A free choice of additional parameters can be visualized at the same time.

The LabOne Plotter displays your impedance data continuously. Below, data from a 100 mΩ resistor over 20 min are displayed. The histogram indicates a standard deviation of only 6 μΩ.

The LabOne Numerical tab displays all impedance related parameters, including model parameters, bias voltage and test signal amplitude, at a glance. The arrangement is freely configurable by the user with only a few mouse clicks. Each value is complemented by a graphical indicator for improved visual perception.

---
Accuracy and measurement ranges

The reactance chart below indicates the instrument accuracy for certain frequency and impedance values. In the wide core area indicated in white, a 0.05% accuracy is specified between 1 mHz and 500 kHz, and 1 Q and 1 MΩ (with limitations towards higher frequencies). The measurement range extends further with reduced specified accuracy of 0.1% and 1% to cover a measurement range from 20 mΩ to 50 GΩ. Even outside this range repeatable measurements are possible but accuracy might drop below 1%. Using the Compensation Advisor improves accuracy even further.

Measuring high impedances at low frequencies can be particularly challenging when values have to be obtained close to the line frequency. Adequate sample shielding along with a sinc-filter and the possibility for battery operation will give you the most accurate results.

High repeatability, fast start-up

Temperature changes of the instrument can severely limit start-up speed and measurement repeatability. The MFIA performs exceptionally well in both aspects as can be seen from the reactance chart below and the start-up drift graph on the next page. You can start the first measurements after only 25 s from powering on the instrument.

Dual frequency operation

The MF-MD option adds a second full 4-Terminal measurement unit to the instrument and allows the user to probe their DUT at 2 frequencies simultaneously. Whenever measurements at multiple frequencies have to be done on a regular basis, this feature can help to simplify the setup and speed up measurements by up to a factor of 2.

These reactance charts indicate the accuracy specification and temperature drift for the different measurement ranges of the MFIA.
Specification

General

Dimensions 28.3 × 23.2 × 10.2 cm 11.1 × 9.2 × 4 inch
Weight 3.8 kg; 8.4 lbs
Power supply AC: 100 – 240 V; DC: 12 V, 2 A
Interface USB 2.0, LAN 1GbE

Basic specification

Frequency range 1 mHz to 5 MHz
Frequency resolution 1 μHz
Basic accuracy 0.05% (1 mHz to 500 kHz)
Basic temp. stability < 200 ppm/K
Test signal level 2T: 0 V to 10 V, 4T: 0 V to 3 V
Bandwidth 276 μHz to 206 kHz
DC bias signal level 2T: ±10 V, 4T: ±3 V
Compensation SO, SOL, LLL, SL, OL, S
Max data transfer rate 107 kSa/s

Measurement parameters, range and basic accuracy

Impedance Z 1 mΩ to 1 TΩ, 0.05%
Voltage V 0 V to 3 V, 1%
Current I 0 mA to 10 mA, 2%
Phases θZ, θV, θI ±180 deg, 10 μdeg resolution
Resistance Rs, Rp 1 mΩ to 1 TΩ, 0.05%¹
Capacitance Cs, Cp 1 fF to 1 kF, 0.05%¹
Inductance Ls, Lp 10 pH to 1 H, 0.05%¹
DC Resistance Rdc 1 mΩ to 1 TΩ, 2%
Reactance X 1 mΩ to 1 TΩ, 0.05%
Conductance G, Susceptance B 1 nS to 1 kS, 0.05%¹
Loss coefficient D 10⁻⁴ to 10'000
Q factor 10⁻⁴ to 10'000

¹Accuracy valid if parameter is the dominant value of the circuit representation.

LabOne Sweeper

Sweep parameters frequency, test signal amplitude, bias voltage, etc.
Sweep points 2 to 100'000
Sweep resolution arbitrary, defined by start value, stop value and number of sweep points
Display parameters Zx, Zy, Zr, Zq, VX, VY, VR, VB, Ix, Iy, IQ, Iq, model parameter 1/2, frequency, Aux. Input
Display options single plot, dual plot (Bode plots), Nyquist, multitrace
Application modes impedance, FRA, 3-omega, etc.
Sweep modes sequential, binary, bidirectional, reverse
Sweep step modes linear, logarithmic
Sweep speed 20 ms/pt for f > 10 kHz

Additional tools and features

LabOne toolset Numerical view, Spectrum Analyzer, Plotter, Data Acquisition, Oscilloscope
APIs C, MATLAB®, LabVIEW®, Python, .NET
Modes 2-Terminal, 4-Terminal
Confidence Indicator suppression, compensation, open, underflow, overflow
Input range control auto, impedance, manual
Test signal amplitude auto, manual
Bandwidth control auto, manual
Replacement circuit models R0 || Cp, Rp || Lp, Rs+Cp, Rs+Ls, G-B, D-Cs, Q-Cs, D-Ls, Q-Ls
DCR measurements yes
Test fixture compatibility yes

Upgrade options and accessories

Option Description
MFITF The Impedance Test Fixture is optimized for low parasitics and includes 12 DUT carrier modules.
MF-MD The Multi-Demodulator option adds a second 4-Terminal measurement unit to analyze a DUT at a second frequency.
MF-DIG The Digitizer option extends the functionality of the oscilloscope by a second channel, continuous streaming and cross-domain triggering.
